

# ganttproject

**Ganttproject**  
is a 100% pure Java application that lets you plan projects using Gantt charts. Ganttproject lets you easily break down a project into tasks, show dependencies, and manage resources.

## *Multi-platform*

Ganttproject is written completely in Java. This allows Ganttproject to be run on any Operating System desired. Ganttproject has been tested for the following OS: GNU/Linux, Microsoft Windows, MacOSX.

## *Plan projects*

With Ganttproject you can easily plan a project in two steps. First insert your tasks and organise them. Next insert the resources and assign them to the different tasks. Making a dependency is as simple as drawing a line between two tasks.

## *File format*

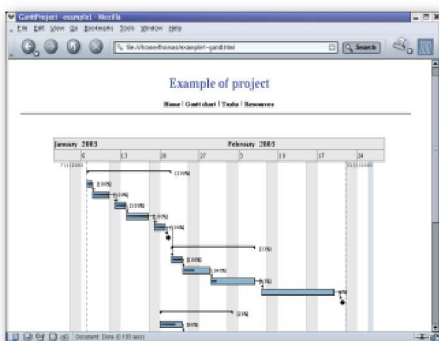

Ganttproject uses a XML file format to save the projects. It can export projects into HTML web pages or PNG images.

## *Characteristics*
